

Fork Positioner for Forklifts

Fork Positioner for Forklift - A fork positioner is actually a device constructed out of high quality materials intended to be able to endure the most challenging operations and work environments. This piece of equipment enables the person driving to operate the forks hydraulically without leaving the seat. Side shifting models have the added ability to be able to laterally position the arms or the entire load in order to facilitate much more accurate lifting and placement in a faster and more efficient way.

The fork pocket is somewhat unique and can enable the individual operating it to securely sway the forks into position without any worry of damaging the positioning cylinders. This allows the operator the option to perform simultaneous or independent fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into blade positioners on existing units.
